Application of power simultaneously initiates timing of the preset OFF time delay (T1) after which the timer's switch is activated turning the load ON for the preset ON time delay (T2). At the end of the preset ON time the timer's switch opens, turning the load OFF, resetting the timer. Power to the timer must be applied continuously throughout the timing period. Removal of power causes the timer to reset. The next cycle can then be initiated by application of power. The delay times T1 and T2 are independently adjustable.

Control the timing of valves, SFHP motors, lamps, relays, magnetic line starters, and actuators rated less than 1 ampere (10 amps inrush). CMOS digital circuitry, with solid state output switching. P/C boards and internal components are encapsulated in a flame retardant molded housing, fitted with quick connect wiring terminals. Available in all standard voltages and frequencies. Fixed or adjustable timing from .1 seconds to 24 hours.
